

Loading `beamerarticle` after `example_sentences`

A beamer frame

- (1) This is an `example_sentences` example. It is typeset the normal way.
- (2) This is another example.
- (3) And another one, also typeset the normal way.

Note If `beamerarticle.sty` is loaded *after* `example_sentences.sty`, the `notheorems`-option *must* be given to `beamerarticle.sty`. Otherwise, L^AT_EX will throw an error, complaining about `\examples` being defined already.

Note If `beamerarticle.sty` is loaded with the `notheorems` option, the `beamerexamples`-environment will not be available unless you define it yourself with the `\newtheorem` command.
