With the [shortform] option, examples can be typeset like this:

- (1) This is an example.
- (2) This is a second example.
 - a. It has sub-examples.
 - b. *Ungrammatical are this sentence.
 - i. And yet, it has sub-examples. Like this one.
 - ii. And this one.

Of course, examples can be in footnotes.¹,²

There are some advanced features, like concise label assignment:

- (3) This example will have the label foo.
- (4) #This example will have the label bar, and will be marked unacceptable.

Now we can refer to the above examples by using $\ensuremath{\mbox{exffoo}}$ and $\ensuremath{\mbox{exref{bar}}}$, like this: (3) and (4).

And if you want to manually supply the example number, use $\ensuremath{\texttt{ex}}$ [(mynumber)] (as with \identified):

(42) This example is numbered 42.

This can be used to do cross-references, like this:

(3) This example will have the label 'foo'.

In [shortform] mode, all the usual commands remain available, and you can mix the two freely (though maybe you should not do that):

- (5) *A sentence.
- (6) Another one.
- (7) ?? Another sentence.

¹Examples in footnotes are numbered differently, but still can be referred to via (i):

⁽i) This is an example in a footnote.

²

⁽i) The footnote counter starts anew in each footnote.
